GP C 101//PHYC101 Mathematics/

Program: M.Sc. Geophysics SES-S-GP-PG (14-2-5-01)
Course: Mathematics/ (Theory); Course code: GP C 101 Core
Instructors: From School of Physical Sciences along with M.Sc Physics Program
Semester: First Semester (summer session)
Credits: 4 credits; Course duration: One semester (15 weeks of 6 day week)
Teaching hours: 4 hours/week

Required Basic knowledge of student:
- Must have studied Mathematics courses at his under graduate level

Course objective
- This course objective is to enable the students to gain an understanding of the applications of mathematics to solve the geophysical problems

Outcome:
- At the end of the course the student will get knowledge to apply mathematics in geophysical modeling and inversion and other related aspects. . . .
Unit I: Vector Spaces and Matrices

Unit II: Special functions
i) Legendre equation, Rodrigues formula for \( P_n(x) \), generation functions and recurrence relation, Associated Legendre polynomial.
ii) Bessel equation, Bessel function of first kind, generating functions and recurrence relation, Associated Legendre polynomial.
iii) Hermite Equation, generating function and recurrence relation for Hermite polynomial.
iv) Laguerre equation, generating function and recurrence relation, Rodrigue formula, Associated Lagurre polynomials.

Unit III: Fourier Series and Integral Transform
Fourier series: General properties of Fourier series, Simple applications, properties of Fourier series, convergence, integration, differentiation.
Fourier Transform, Laplace Transforms, Properties of Fourier and Laplace transforms (Linearity, first shifting and second shifting property), Fourier sine and cosine transforms, Fourier and Laplace transform of derivatives, elementary Laplace transform, Inverse Fourier and Laplace transforms, shifting theorem, step function, Solution of simple differential equation using Laplace Transform technique.

Unit IV: Complex function and Calculus of Complex function
Definition of complex function, exponential function and properties, circular function and properties, hyperbolic function and properties, Inverse hyperbolic function, logarithmic function, limit of a complex function, continuity, derivative (theorm), analytic functions, harmonic functions, complex integration, Cauchy’s theorem, Cauchy’s integral formula, Series of complex term-Taylor’s series, Laurentz series. Zeros of an analytical function, Singularities of an analytical function (isolated, removable, poles and essential singularity), Residue Theorm-Calculus of residues.

**Required Basic knowledge of student:**
- Must have studied Mathematics courses at his under graduate level and basic knowledge of computer programming

**Course objective**
- This course objective is to enable the students to gain an understanding of the Numerical Methods to solve the geophysical problems and to learn the programming skills

**Outcome:**
- At the end of the course the student will get knowledge of numerical techniques to solve geophysical problems, the student also acquire skills in developing computer programs in geophysical applications. The knowledge acquired in this course will be useful acquire knowledge of geophysics in coming semesters and also after graduation.
Unit I: Curve fitting and interpolation
The Principle of Least squares, fitting a straight line, fitting a parabola, fitting an exponential curve, fitting curve of the form $y=ax^b$, fitting through a polynomial, Cubic spline fitting, Linear interpolation, difference schemes, Newton’s forward and backward interpolation formula.

Unit-II: Numerical integration
Newton cotes formula, trapezoidal rule, Simpson’s one third rule, Simpson’s three eight rule, Gauss quadratics method, Monte Carlo method: Solution of differential equation
Taylor series method, Euler method, Runge Kutta method, predictor-corrector method

Unit-III: Solution of simultaneous equation
Gaussian elimination method, pivotal condensation method, Gauss-Jordan elimination method, Gauss-Seidal iteration method, Gauss-Jordan matrix inversion method, Gaussian-elimination matrix inversion method ; Eigen values and eigenvectors of a matrix- Computation of real eigen values and corresponding eigenvectors of a symmetric matrix, power method and inverse power method. Partial differential equations- Difference equation method over a rectangular domain for solving elliptic, parabolic and hyperbolic partial differential equation

Unit-IV: C- Programming
Elementary information about digital computer principles, compliers, interpreters, and operating systems, C programming, flow charts, integer and floating point arithmetic, expression, build in functions, executable and non-executable statements, assignment, control and input-output elements, user defined functions, operation with files: pointers, Random numbers:
Random numbers, Random walk, method of importance sampling.

Reference books:
2. Suresh Chandra Computer Applications in Physics with FORTRAN, BASIC and C, Narosa Publishers
5. Rajaraman: Numerical analysis.
8. Advanced engineering mathematics – Erwin Kreszing 5th or 7th edition john Willey and sons inc.
9. C Programming : Balgurusamy

**Required Basic knowledge of student:**

- Basic knowledge about physics and Earth

**Objective:**

- This course objective is to introduce the student about the basic physical process, properties in understanding the Earth and its process. This course forms as a foundation course for a student to gain overall understanding of the Geophysics subject and its approach.

**Outcome:**

- At the end of the course the student will get knowledge of physical concepts and Earth processes. With the knowledge acquired in this course the student gets foundations in understanding the subject in further semesters. . . . .
Unit I
History of development and scope of geophysics, hypotheses for the origin of solar system, Kepler's law of planetary motion, planet and satellites of the Solar system and their characteristics, Internal constitution of the earth, Characteristics of Crust, Mantle and Core, lithosphere, and asthenosphere.

Unit II

UNIT III
Origin of geomagnetic field, secular variations and westward drift, geomagnetic time scale, geomagnetic storms, Earth's current, sun spot, solar flares, lunar and solar variations, Palaeomagnetic studies of rock samples and their applications in geophysics, polar wandering, reversals of geomagnetic field. Geomagnetic time scale Gravity and Figure of the Earth, international gravity formula and rotation of the earth. Concept of isostasy, Airy, Heiskanan and Pratt-Hayford hypotheses.

UNIT IV
Introduction to seismology, Introduction to earthquake phenomena, concept of focus, focal depth, epicenter, great Indian earthquakes, intensity and magnitude scales and energy of earthquakes, foreshocks and aftershocks, elastic rebound theory, seismicity of India, Himalayas and global seismicity, seismic microzonation, seismic zoning of India,

1. Planet Earth by Press and Siever
2. Fundamentals of Geophysics by Lowrie
3. The Solid Earth by Fowler
4. Introduction to seismology by Peter Shearer
5. Introduction to Geophysics by Howell
6. Physics and Geology, by Jacobs and Russel
7. Physics of the earth, by Stacey
8. The interior of the earth, by M.H.P. Bott
9. Topics in Geophysics, by P.J. Smith

GP C 106 Related Practical
GP E 101 Basic Geology

Course: Basic Geology (Theory); Course code: GP E 101 Elective
Instructor: Faculty from Geology discipline
Contact details:
Semester: First Semester (summer session)
Credits: 3 credits; Course duration: One semester (15 weeks of 6 day week)
Teaching hours: 3 hours/week

Required Basic knowledge of student:
- Basic knowledge of geography or geology,

Objective:
- This course objective is to introduce the student about the basics of geology which is essential as the geophysics is applications of physics to solve geological processes. At the end of the course the student gains the knowledge of essentials of geology to study geophysics.

Outcome:
- Very essence of geophysics is to apply the physical principles to understand the geological processes. After the course the student gets basic knowledge of geology in tune with the geophysical applications. The knowledge acquired in this course will be useful to acquire knowledge of geophysics and its complete understanding in coming semesters and also after graduation.
GP E 101 Basic Geology
3 credits

Unit 1:
Introduction to geology, Geology as a fundamental science; branches of geology and relationships with other branches of science, weathering agents, Introduction to geomorphology Folds, faults, unconformities, joints and their classification, Geological time scale, "Earth System: Lithosphere, Hydrosphere, Cryosphere and Atmosphere and their interactions

Unit 2
Mineralogy : Mineral - its definition and mode of occurrence, physical properties of minerals like form, colour, lustre, streak, cleavage, fracture, hardness and specific gravity, Physical characters and chemical composition of different rock forming minerals.

Unit 3
Petrology : Rock – its definition; classification and distinguishing characteristics of Igneous, Sedimentary and Metamorphic rocks; forms of Igneous rocks, elementary ideas regarding formation; Texture and structure of Igneous, Sedimentary and Metamorphic rocks; Brief petrographic description and occurrences different rocks :

Suggested Books:
1. The Earth: Press and Seiver
2. Blue Planet: Skinner and Porter
3. Physical Geology: Arthur Holmes
4. A Text Book of Geology: P.K. Mukherjee
5. Engineering Geology: Purbin Singh
6. Earth Materials: Klein and Philpotts
7. Principles of Petrology by Tyrrell
8. Elements of Mineralogy by Read & Rutley’s

Required Basic knowledge of student:
- Basic knowledge of geography or geology, This course is recommended for those who already studied geology in their graduation and are confident about their concepts about geology

Objective:
- This course objective is to introduce the student about the understanding of the Earth System, various components and its interrelation. This helps the student to gain knowledge about the overall interaction and processes of various systems of the Earth...

Outcome:
- At the end of the course the student gains the knowledge of Earth and understanding the interrelation between various spheres the knowledge acquired in this course will be useful to acquire knowledge of geophysics and its complete understanding in coming semesters and also after graduation...
GP E 102 Earth System Sciences
Detailed syllabus)

Unit 1
Earth as a planet Holistic understanding of dynamic planet 'Earth' through Astronomy, Geology, Meteorology and Oceanography. Introduction to various branches of Earth Sciences. General characteristics and origin of the Universe, Solar System and its planets. Earth and Planetary system, size, shape, internal structure and composition of the earth; atmosphere and greenhouse effect;

Unit 2:
Plate Tectonics Concept of plate tectonics, sea-floor spreading and continental drift Geodynamic elements of Earth- Mid Oceanic Ridges, trenches, transform faults and island arcs Origin of oceans, continents, mountains and rift valleys Earthquake and earthquake belts Volcanoes- types, products and their distribution.

Unit 3:
Lithosphere, Hydrosphere and Atmosphere, Internal structure of the Earth, isostasy; elements of seismology; physical properties of the interior of the earth; continents and continental processes Introduction to Earth and formation theories. Seismicity and earth’s interior.Compositional and Rheological divisions of Earth; crust, mantle and core; discontinuities. Earth’s magnetic field, paleomagnetism, continental drift, plate tectonics.

#### Required Basic knowledge of student:
- Basic Physical concepts of gravitational field of the Earth

#### Objective:
- This course is intended to discuss about the gravitational field of the Earth and its applications in Geophysics. Density variations of Earth materials, gravity method concepts, instrumentation, data acquisition, data processing, data analysis and data interpretation of gravity data and its applications.

#### Outcome:
- At the end of the course the student get knowledge about gravitational field and its applications. The student will be in a position to use gravitational methods in the geoaexploration, resource evaluation, figure of the Earth and geological mapping.
GP C 201 Gravity Method

Unit I
Earth’s Gravity Field, principle and Characteristics, Properties of Newtonian potential, Laplace’s and Poissons’ equations, Green’s theorem, Gauss law - Rock densities and factors affecting density, density measurement techniques of the samples, concept of gravity anomaly, gravity prospecting instruments, zero length spring, Worden & Lacoste gravimeters, Absolute gravimeters.

Unit II
Gravity units, concept of geod and spheroid, gravity base, collection of gravity data, drift correction, reduction of gravity, Bouguer gravity anomalies, airborne and ship borne gravimetry, Isostacy.
Plan of gravity surveys, presentation of gravity data, Concept of noise, regional and residual anomalies, methods of calculation, upward and downward continuation, derivative calculations, Fourier transformations and Harmonic analysis. Ambiguity in gravity

Unit III
Interpretation of gravity data- qualitative interpretation, identification of two and three dimensional bodies, structural features, quantitative interpretation, conventional methods of interpretation techniques- thumb rules and methods of characteristic curves, gravity anomalies of geophysical models- point mass, line mass, discs, cylinders, sheets, faults, slabs, irregular shaped bodies.

Unit IV

Books:

2. Gravity and Magnetic interpretation in Exploration Geophysics by I.V.R. Murthy
3. Applied geophysics by W.W. Telford
4. Introduction to Geophysical prospecting by M.B. Dobrin
5. An Introduction to Geophysical Exploration by Philip Kearey, Michael Brooks and Ian Hill

**Required Basic knowledge of student:**
- Basic Physical concepts of gravitational field, Acoustic wave propagation, magnetic field, electrical and electromagnetic field of the Earth

**Objective:**
The objective of this course is that students learn how to reconstruct continuous signals from sampled ones, filtering techniques, discrete Fourier transforms in the analysis and processing of digital signals...

**Outcome:**
- At the end of the course the student will get knowledge for geophysical data processing of both continuous and discrete data. After completing the course the student will get knowledge in the data processing of gravity, magnetic and seismic signals, which the student will be dealing in further semesters. The students become adept at using discrete Fourier transforms in the analysis and processing of digital signals.
GP C 202 Signal processing (4 credits)

Unit I

Unit II
Fourier series, Gibbs phenomenon, fourier transforms, time and frequency domain, fourier transforms and some important functions – rectangular, periodic, exponential, singularity, Spectral analysis, FFT.

Unit III
Time series analysis, correlation, convolution, impulse response and transfer function, Z-transform Hilbert transform, wavelets. Waveform processing, power spectrum, Wiener-Khintchin theorem.

Unit IV

Books:

## Required Basic knowledge of student:
- Basic Physical concepts of Electricity,

## Objective:
- This course is intended to impart knowledge about the various electrical properties of Earth materials, methods developed based on the electrical properties, instrumentation, data acquisition, data processing, data analysis and data interpretation of electrical data and its applications. .

## Outcome:
- At the end of the course the student gets knowledge about Electrical methods and its applications. The student will be in a position to use Electrical methods in the geoexploration, resource evaluation, figure of the Earth and geological mapping. .
GP C 203 Electrical Methods

Unit -I
Electrical fields in geophysics, Principles and classification of Electrical methods of prospecting, current and potentials, electrical properties of the rocks, current flow in ground, Electric conduction in rocks, factors affecting electrical conduction in rocks, isotropy, anisotropy, principles of equivalence, Dar Zarrouk parameters- Longitudinal conductance and transverse resistance.

Unit II
Self potential (SP) – origin, measurement, field technique, SP anomalies over different models, interpretation of SP anomalies. Applications of SP method.

Unit III
Types of VES curves- Interpretation-Curve matching, partial curve matching techniques- direct and indirect methods of interpretation – resistivity transform functions.
Resistivity profiling over fault, vertical contacts, buried 2-d and 3-D bodies, estimation of overburden thickness. Application of resistivity methods in various applications like groundwater, mineral, geotechnical and geological mapping.

Unit IV

Books:
- Applied geophysics by W.W. Telford
- Introduction to Geophysical prospecting by M.B. Dobrin
- An Introduction to Geophysical Exploration by Philip Kearey, Michael Brooks and Ian Hill
- Applied Geophysics, Telford, et. al., revised edition
- Electrical methods of Geophysical Prospecting, Keller and Frischknecht
- Mining Geophysics, Parasnis

**Required Basic knowledge of student:**

- Basic knowledge of geology, of undergraduate course are must have studied Basic geology/ Earth System Studies course at first semester in this school

**Objective:**

- This course objective is to introduce the student about the geology which is essential as the geophysics is applications of physics to solve geological processes. At the end of the course the student gains the knowledge of essentials of geology and relevant geological inputs to study geophysics.

**Outcome:**

- After the course the student gets basic knowledge of geology in tune with the geophysical applications. The knowledge acquired in this course will be useful to gain skills in geophysics and its complete understanding in coming semesters and also after graduation.
Unit I:

Petrology: Different kinds of rocks – igneous, sedimentary and metamorphic rocks - their physical properties and its variations, factors affecting the physical properties of different rocks

Folds: Nomenclature of folds, Types of folds, origin of folds, identification of folds in the field

Unit II:

Structural geology - Faults, folds and joints: Nomenclature, types, mechanisms, identification in the fields. of Faults, Types of Faults, Fault Mechanism, Identification of Faults in the field. Geological structures and associated physical processes.

Unit III:

Geotectonics: Convection currents, Plate, types of plates, plate boundaries, causes of plate movement, Rifting of continent, Subduction zone, island arcs, mid oceanic ridges, Hot Spot, Formation of Deccan Shield, Collision and its types,

Suggested Books:

1. Fundamentals of Structural Geology: Pollard & Fletcher
2. Foundations of Structural Geology: R. G. Park
3. Structural Geology: Marland Pratt Billings
4. The Techniques of Modern Structural Geology: John G. Ramsay
5. Introduction to the Structure of the Earth: Edgar Winston Spencer

GP E 202 Geo dynamics

Unit 1
Geology and geodynamics, Lithosphere, hydrosphere and atmosphere, endogenic and exogenic forces, Internal constitution of the earth, Crust, mantle and core, characteristics of lithosphere and asthenosphere, causes of geodynamical process, geodynamic models

Unit 2:
Rock forming minerals, Classification of rock formations, rock cycle and geodynamic processes, Geological action of agents like water and wind, weathering, soil formation, atmosphere and climatic changes,Geomagnetism, paleomagentism

Unit 3
continental drift, ocean floor spreading, plate tectonics and its geological implications, new global tectonics and plate margin process, geomagnetic time scale, Benioff zones, oceanic ridges, evolution of the triple junction, trenches and island arcs, hot (20) spots, geodynamics of Indian subcontinents and formation of Himalayas, 900 E ridge, concept of isostasy, Airy, Heiskanan and Pratt-Hayford hypotheses

Suggested books
1. Fundamentals of Structural Geology: Pollard & Fletcher
2. Introduction to the Structure of the Earth: Edgar Winston Spencer
3. Flow Processes in Faults and Shear Zones: G. Ian Alsop
4. Plate Tectonics: Continental Drift and Mountain Building: Wolfgang Frisch, Martin MesChede, Ronald C. Blakey
5. Plate Tectonics: Kent. C. Condie
6. Mantle convection: Plate Tectonics and Global Dynamics: W.R. Peltier
7. When Did Plate Tectonics Begin on Planet Earth: Kent. C. Condie and Victoria Pease
8. Geomagnetism by Jacob
9. The Earth: Press and Seiver
10. Blue Planet: Skinner and Porter
11. Physical Geology: Arthur Holmes
13. Oceanography: A view of the earth by Gross, M. G.
